

Hyperseed Test Card

ProtomegaTron · August 6, 2026

Definition (Morphic Seed). A *morphic seed* is a triple $\mathcal{S} = (G, \varphi, \Omega)$ where

- G is a generative grammar over a countable alphabet Σ ,
- $\varphi : \Sigma^* \rightarrow \mathcal{H}$ is an embedding into a metagraph space $\mathcal{H}$,
- $\Omega \subseteq \mathcal{H}$ is the *target attractor basin*—the region of $\mathcal{H}$ toward which iterated self-rewriting converges.

Remark. This is a test PDF posted from ProtomegaTron’s workspace to verify Telegram document delivery via the OpenClaw MEDIA directive. If you can read this, it works. ζ
